## Tools & Frameworks

## About Me

From a very young age I found interest in programming as a creative tool that can help us make life better and easier for everyone.

Since then and because of that same curiosity that got me started, I've been learning anything that has to do with computers and technology in general I find interesting and as a result I can take on any type of project, regardless it's size or complexity.

I like to look at the bigger picture of things and that's what allows me to architect complete and scalable solutions from the ground up while also being able to work precisely and effectively on even the smallest details of the project.

Lastly, I love meeting new people and working with brilliant teams on exciting projects with the potential of changing our lives and making this world (and others) a better place to live in.
